DATA SCIENCE

Dedicated and enthusiastic data science professional with a strong foundation in data analysis, machine learning and statistical modeling. Proficient in data manipulation, Data Visualization, and Predictive Analytics, with hands-on experience in both academic and real-world projects. Gained hands-on experience by developing a full-stack project using Next.js, integrating AI and Data Science techniques to deliver intelligent and data driven functionality.

EXPERIENCE

Junior AI Engineer

Excels Tech Solution LLC

04/2026 – Present

Lahore, Pakistan

- Develop AI-powered web applications using Python, FastAPI, Next.js, and REST APIs, delivering scalable solutions for client projects.
- Contribute to the development and deployment of AI-powered platforms, including AIPowerEmail.com 🔗 and AIRAGChatbot.com 🔗, building intelligent automation and conversational AI features.
- Build and automate AI workflows using n8n, reducing manual processes and improving operational efficiency.
- Integrate Large Language Models (LLMs) to develop intelligent chatbots, document processing systems, and AI-driven automation solutions.
- Design and implement Retrieval-Augmented Generation (RAG) pipelines using Pinecone and vector embeddings, improving AI response accuracy.
- Develop WhatsApp Business API chatbots with automated workflows for customer support and business process automation.
- Build web scraping and data extraction solutions using Python and Playwright to collect, process, and analyze large-scale business data.
- Optimize PostgreSQL and Supabase databases, improving backend performance, application reliability, and API response times.
- Collaborate with cross-functional teams using Git and Agile methodologies to deliver production-ready AI applications on schedule.

Project: UMT HR and Faculty Management System

Description :

- A web-based portal designed for UMT HR , Faculty, and Admin to manage faculty records, handle HR operations and Faculty Operations.

Role:

- Developed the frontend interface using Next.js with TypeScript, implemented interactive and responsive UI components, and handled backend routing logic for smooth communication between frontend and database.

Technologies:

- Next.js, TypeScript, Supabase (Database), Neon Postgress, ORM's

Software Engineer

Coding Caliber

Duration: 3 Months

- Developed and deployed AI chatbot solutions using Python, improving automated response handling and workflow efficiency.
- Built automation pipelines using n8n, reducing manual task processing and increasing operational productivity.
- Integrated REST APIs, backend logic, and third-party services for seamless system communication.
- Designed end-to-end automation systems including triggers, processing logic, and execution flows.
- Performed debugging, testing, and performance optimization of automation scripts to ensure reliability and scalability.

- Collaborated with development teams to implement real-world automation solutions aligned with project requirements.

Key Skills: Python, n8n, API Integration, Automation Development, Chatbot Development, Backend Logic, Workflow Automation, Debugging, Testing, Fast API, Nextjs(TypeScript), Docker, RAG

SKILLS

Programming Languages

Python, Next.js Framework, Typescripts, JavaScript, React, Flask Framework, FastAPI,nodejs

Data Analysis

Pandas, Numpy

Data Visualization

Matplotlib, Seaborn

Version Control

Git version Control

Libararies & Framework

Machine Learning,Scikit-learn, XGBoost, Deep Learning, TensorFlow, Keras

DataBase

Microsoft SQL Server, MoongoDB, Postgress(Supabase, NeonDB), SQLite

Tools

Jupyter Notebook, Google Collaborator, Cisco Packet Tracer, Strapi Headless CMS(Content Management System), Open CV, apify, playwright, patchright, crawlee, N8N, Docker, RAG, SMTP, AWS SES, Medusa.js

PROJECTS

AI Power Email

05/2026 – Present

Developed AI Power Email, an AI-powered email marketing platform featuring AI-generated content, automated campaigns, intelligent A/B testing, smart follow-ups, and advanced email deliverability optimization.

AI RAG Chatbot

06/2026 – Present

Developed AIRAGChatbot.com [🔗](#), an AI-powered customer support platform that enables businesses to create, train, and deploy intelligent chatbots using Retrieval-Augmented Generation (RAG), LLMs, and custom knowledge bases for accurate, context-aware response

WhatsApp Business Chatbot

Final Year Project (In Progress)

Developing an AI-powered WhatsApp chatbot to automate customer support and business workflows for small businesses.

- Built backend in Python for message processing and intent handling
- Integrated WhatsApp Business API for real-time interactions
- Designed automated responses for FAQs and product queries
- Implemented webhooks and session management for multi-user chats
- Focused on scalable architecture for multi-business support

Fashion Connect Full-Stack Web Application

Built a dynamic fashion platform using Next.js and Strapi CMS, enabling designers to showcase collections and users to browse with a clean, scalable UI.

- Developed responsive frontend with Next.js and reusable UI components.
- Integrated Strapi RESTful APIs for collections, categories, and profiles.
- Implemented secure authentication and state management with Zustand.

Instagram Insights Scraper

Data Extraction Tool

Built a full-stack scraping system to collect Instagram posts, reels, profiles, and engagement data for analytics.

- Developed automated scrapers using Python, FastAPI, and Apify Crawlee
- Extracted captions, media metadata, and engagement metrics
- Implemented logic to identify similar and trending profiles
- Built REST APIs for data access and dashboard integration
- Optimized performance with async processing, retries, and rate-limit handling

Hand Gesture Recognition Computer Vision

Created an intelligent real-time gesture recognition system using OpenCV, MediaPipe, and CNNs.

- Tracked hand landmarks with MediaPipe and webcam input.

- Classified gestures (thumbs up, open palm, fist) with CNN model.
- Mapped gestures to system commands.

Crypto Price Prediction ML System

Developed a machine learning system to forecast cryptocurrency prices using real-time API data and multiple predictive models. Implemented models: Random Forest, Linear Regression, ANN, LSTM, Gradient Boosting

- Performed data preprocessing, feature engineering, and normalization
- Evaluated models using MAE, RMSE, and R^2 metrics
- Applied hyperparameter tuning and cross-validation for accuracy
- Automated real-time data pipeline for continuous prediction updates

Library Management System Python & SQL

Collaborated in a 4-member team to create a library system handling book records, profiles, and transactions.

- Implemented features: borrow/return tracking, fines, search, and reporting.
- Built modular OOP, based code structure in Python
- Designed and managed relational data with Microsoft SQL Server.

EDUCATION

BS Data Science (Graduate)

Superior University

ICS in Physics

Punjab Group of College
